

The new

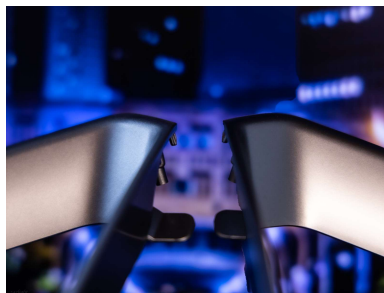

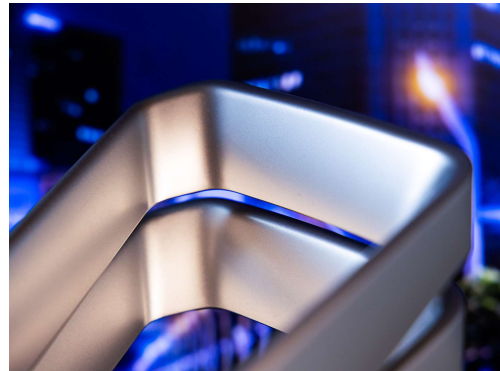

UV-Metallic-Coatings

Durable protection for highest value.

The modern trend towards metallic effects calls for new innovations

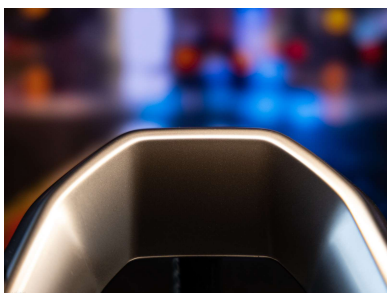

Our 1-layer UV metallic paint is an innovation in the field of matt and semi-gloss chrome effects or metal effects.

Due to its special properties, it is ideally suited for use both in the interior of automobiles for highly stressed surfaces up to the steering wheel, as well as for high-quality surfaces in household appliances.

The new UV metallic paints for coating plastic surfaces offer many advantages:

- 1-layer, only one coating process required. This leads to great savings in process and painting costs and to a considerable improvement in the reject rate.
- High scratch protection properties
- High chemical resistance
- Is available in different color and degrees of gloss (up to 85°)
- UV Dualcure - can be processed on all common coating systems

We fulfill (almost) all your wishes for design and surface:

- We offer you one of the best systems on the market
- We supply individual coatings in large and small batches
- Your application will be intensively supported by us
- An individual setting of the paint parameters for your application enables a high-quality result
